Bel Air Announces Breakthrough In Super-Polishing of Aerospace & Aircraft Parts

Bel Air Finishing Supply has developed a new technology for super polishing and finishing aerospace and aircraft blades, blisks and other engine and compressor components.

The Bel Air process produces extremely low surface Ra measurements, is repeatable and slashes finishing time from hours to just minutes.

Our new technology employs equipment that uses a new “dry process media.” In most cases no water is required, eliminating both the cost and mess associated with wet processing and expense of wastewater treatment and disposal.

The small footprint of this equipment and its ease of use allow manufacturers to bring the entire polishing process in-house. This reduces reliance on sub-contractors and provides significant savings by cutting the cost of shipping.

“This new state-of-the-art equipment gives manufacturers total control and accomplishes in-house what often requires outsourcing,” stated Bel Air President Steve Alviti.

Bel Air engineers and finishing experts are assisting manufacturers in developing turn key finishing systems that can include metrology equipment. This guarantees quality results in real time enabling you to deliver the perfectly finished parts that customers demand.

Learn how your business can benefit from this breakthrough technology. Call Bel Air Finishing Supply at 401-667-7902, or visit our web site at www.belairfinishing.com.

You are receiving this email because you are a customer, have done business with us, or you're really awesome and we want to keep you in the know!
